APPLICATION FOR DIRECT SALE OF PRODUCTS BY FARMERS.

ABSTRACT:

Village Direct Market is a mobile-friendly web application designed to help farmers sell their products directly to customers without the involvement of middlemen. The platform provides a simple and easy-to-use interface where farmers can upload and manage products such as dairy items, vegetables, fruits, handicrafts, and stitching products. Each product is displayed with an image, price, and short description to make browsing easier for customers. To support rural users, the application includes a voice-based upload feature so farmers can add products more conveniently. The website also offers cart functionality, order placement, and payment options such as Cash on Delivery and UPI. By connecting farmers directly with consumers, this project aims to improve accessibility, increase profit for farmers, and promote transparent local trade.

1. INTRODUCTION:

1.1 ABOUT PROJECT

- Agriculture is one of the most important sectors in rural India, but many farmers still face difficulties in selling their products at fair prices. In most cases, middlemen are involved between farmers and customers, which reduces the profit earned by farmers and creates delays in the selling process. To overcome this problem, we developed a simple and mobile-friendly website called **Kisan Direct**.
- The main aim of this platform is to connect farmers directly with customers so that products can be sold without mediators.
- This website provides a user-friendly interface where farmers can upload and manage their products easily. It includes categories such as dairy products, vegetables, fruits, handicrafts, and stitching items, so customers can browse items based on their needs.
- Each product is shown with an image, price, and short description, making it easy for buyers to understand the product details quickly. The website also includes a voice-based upload feature, which helps farmers add products more conveniently without depending too much on typing.
- The platform is designed especially for rural users, so simplicity and clarity are given priority in the user interface. Large buttons, easy navigation, and a clean layout make the website accessible on mobile devices.
- It also supports cart management, order placement, and payment options like Cash on Delivery and UPI, making the buying process convenient for customers. Overall, this project is a practical design-thinking solution that aims to support farmers, reduce dependency on middlemen, and promote direct trade between producers and consumers.

1.2 PROBLEM STATEMENT:

- Farmers often depend on middlemen to sell their products, which lowers their earnings and limits direct customer interaction. There is a need for a simple digital platform where farmers can list products and customers can buy them directly. The solution should be easy to use, mobile-friendly, and suitable for rural users.

1.3 OBJECTIVES:

- To help farmers sell products directly to customers.
- To reduce dependence on middlemen.
- To provide a simple and accessible website for rural users.
- To include product categories with images, prices, and descriptions.
- To support voice-based product uploading for farmers.
- To enable cart, order placement, and payment through COD and UPI.

1.4 IDEATION AND CONCEPT:

We brainstormed multiple ideas and selected a direct-selling e-commerce model for farmers. The main concept was to create a marketplace where farmers can upload products by voice or manually, and customers can browse by category. The final concept was chosen because it is practical, user-friendly, and useful for both farmers and buyers .

1.5 USER RESEARCH / EMPATHY:

During the design thinking process, we identified that farmers need a system that is simple, fast, and easy to understand. Many rural users may not be comfortable with complex forms or advanced technology, so the interface should use clear language, large buttons, and a clean layout. A mobile-responsive design is important because smartphones are widely used and are often the easiest way to access such platforms.

SOURCES OF INCOME GENERATION

From Farming to Entrepreneurship!

PROBLEM STATEMENT:

- Income in villages mainly depends on agriculture which is seasonable and unstable.

Scope of Rural Business

CHALLENGES:

- Seasonal income.
- Weather dependence.
- Limited jobs.
- Low wages.
- Lack of technology.

Sources of Income Generation in Villages

CONCLUSION:

- Villages have many income sources like farming, dairy, small businesses and labor.
- Improving skills, technology and job opportunities can increase rural income.

2.1 PROTOTYPE DESCRIPTION:

The prototype was built as a simple website using Replit. It contains category-wise sections for dairy, vegetables, fruits, handicrafts, and stitching items. Each item includes an image, price,

and short description. The site also includes a cart system, order placement page, and payment methods such as cash on delivery and UPI .

Main features

1. Category-wise product display.
2. 7–8 items per category.
3. Product images, prices, and descriptions.
4. Voice/microphone feature for farmers to upload products easily.
5. Cart and checkout system.
6. Order placement option.
7. Payment support for COD and UPI.
8. Simple, mobile-friendly, and visual UI.

4. RESULTS:

- The developed website provides a direct digital link between farmers and customers. It reduces the need for middlemen and makes product selling more convenient. The simple design improves usability for rural users, while the voice feature helps farmers enter products more easily. Overall, the prototype demonstrates how technology can support fair selling and better market access for farmers .
- The Village Direct Market website successfully provides a direct platform for farmers to sell their products to customers without middlemen. It makes product listing, browsing, and purchasing simple and convenient. The voice upload feature and mobile-friendly design make the system easier for rural users to use. Overall, the project helps improve farmer earnings, supports direct trade, and creates a practical solution for local product sales.

4. FUTURE SCOPE:

- In the future, the project can be improved by adding more product categories.
- It can support multiple languages for easier use by rural users.
- A user login system can be added for farmers and customers.
- Delivery tracking can be included to make orders more convenient.
- More payment options can be provided for better flexibility.
- A chat feature can help farmers and customers communicate directly.
- Product ratings and reviews can be added for trust and quality.
- The website can be converted into a mobile application.
- Advanced search and filter options can improve user experience.

5.CONCLUSION:

- The **Village Direct Market** project is a simple and practical solution for helping farmers sell their products directly to customers without depending on middlemen. By using a mobile-friendly website, the platform makes it easier for farmers to display their products, share details, and reach buyers in a transparent way. This can help farmers get better value for their products and improve direct communication with customers.
- The website is designed with rural users in mind, so it focuses on simplicity, clarity, and ease of use. Features like category-wise product listing, product images, price display, voice-based upload, cart, order placement, and payment options such as COD and UPI make the platform useful and accessible. These features reduce the difficulty of online selling and make the system more convenient for farmers.
- Overall, this project shows how design thinking can be used to solve a real-world problem in agriculture. It not only supports farmers in increasing their sales opportunities but also helps customers buy fresh and locally made products directly from producers. In the future, this platform can be improved further by adding more language support, delivery tracking, and advanced user features to make it even more effective.
